1.0 Introduction

Spire STL Pipeline, LLC (Spire) is proposing the Spire STL Pipeline Project (Project), located in Scott, Greene, and Jersey Counties, Illinois (IL), and St. Charles and St. Louis Counties, Missouri (MO) (Figure 1). The proposed Project will consist of approximately 65 miles of new 24-inch-diameter steel pipeline in two segments. The first segment (referred to as the "24-inch pipeline" portion of the Project) will originate at a new interconnect with the Rockies Express Pipeline LLC ("REX") pipeline in Scott County, Illinois and extend approximately 59 miles through Greene and Jersey Counties in Illinois before crossing the Mississippi River and extending east through St. Charles County, Missouri. The 24-inch pipeline then crosses the Missouri River into St. Louis County, Missouri, and terminates at a new interconnect with Laclede Gas Company ("LGC"). The second segment of pipeline (referred to as the "North County Extension"), will consist of a new 24-inch-diameter steel pipeline which will extend approximately six miles from the LGC interconnect through the northern portion of St. Louis County and terminate at a new interconnect with Enable Mississippi River Transmission, LLC ("Enable MRT") and LGC. The total length of the Project pipeline will be approximately 65 miles. The Project also includes the construction of three new metering and regulating ("M&R") stations that provide interconnects with (1) REX in Illinois, (2) LGC in Missouri, and (3) Enable MRT and LGC in Missouri.

GAI Consultants, Inc. (GAI), on behalf of Spire, conducted field and desktop wetland delineations and stream investigations of the Project study area from September 2016 through June 2017. GAI identified the boundaries of waterbodies and wetlands located within an approximately 300-foot wide corridor, generally centered on the proposed pipeline centerline. Field delineations were completed across parcels with landowner-granted access and desktop delineation methods were used where permission was not granted at the time of survey. This report describes the results of the environmental field surveys and desktop delineation within the revised Project study area.

2.0 Results

Project study area topography generally consisted of low-relief till plains and dissected till plains within the Central Lowland Province of the Interior Plains physiographic region. Land use consists primarily of agricultural lands and areas flooded to enhance wildlife habitat. The southern portion of the Project is primarily located within suburban residential communities.

On March 18, 2017 the United States Army Corps of Engineers reissued their Nationwide Permits, including revisions to regional conditions, as well as state water quality certification conditions. These updated conditions have been incorporated below as there have been several additions since the onset of the Project.

As per Missouri Nationwide Permit Regional Conditions under Section 404 of the Clean Water Act:

- ▶ The Project will follow stream crossing guidelines outlined in Regional Condition 1. No new culverts or low water crossings are proposed.
- ▶ No Project area waters are listed on the Missouri Combined Stream Spawning List restricted waterbodies (Available at:
<http://www.nwk.usace.army.mil/Portals/29/docs/regulatory/nationwidepermits/2012/SpawningList.pdf>);
- ▶ Invasive and exotic species will not be utilized for revegetation following construction of the Project. (Available at:
<http://www.nwk.usace.army.mil/Portals/29/docs/regulatory/nationwidepermits/2012/MOInvasivePlants.pdf>;
- ▶ Only suitable material will be used for backfill within all Waters of the U.S.;

- ▶ The Project area is not located within a Priority Watershed (Available at: <http://www.nwk.usace.army.mil/Portals/29/docs/regulatory/nationwidepermits/2012/PriorityWatersheds.pdf>);
- ▶ No Project area wetlands have been classified via field or desktop as a jurisdictional fen, seep or bog as defined by the Environmental Protection Agency (Available at: <https://www.epa.gov/wetlands/wetlands-classification-and-types#bogs>); and
- ▶ No Project area waters are considered Sensitive Aquatic Species Waters (Available at: <http://www.nwk.usace.army.mil/Portals/29/docs/regulatory/nationwidepermits/2012/MORC7AquaticSpecies.pdf>).

As per Missouri Department of Natural Resources Section 401 Water Quality Certification General and Specific Conditions:

- ▶ No springs were identified within the Project study area;
- ▶ In-stream work will be limited to the shortest duration practicable and only within the immediate vicinity of the crossing as to limit disturbance. The work area shall be sealed off from flow to avoid sedimentation.
- ▶ Only suitable material will be used for backfill within all Waters of the U.S.
- ▶ No Project waterbody is listed as impaired by inorganic sediment, aquatic habitat alteration, or unknown impairment as listed on the most current Section 305(b) waterbody report (Available at: <http://dnr.mo.gov/env/wpp/waterquality/303d/303d.htm>);
- ▶ The Project is not located within or within two miles upstream of a designated outstanding state or national resource water (10 CSR 20-7 Table D or Table E); and
- ▶ The Project is located within the Coldwater Creek Metropolitan No-Discharge stream watershed (10 CSR 20-7 Table F). Crossings are proposed within this watershed and therefore requires Individual Water Quality Certification.
- ▶ Excavated material shall not be side cast into Waters of the U.S.
- ▶ Horizontal directional drills will be utilized where applicable. BMP's will be followed to avoid discharge of drilling mud into Waters of the U.S.
- ▶ Stream crossings will be constructed as close to perpendicular as practicable.
- ▶ New utilities lines that cross more than one jurisdictional water resulting in greater than 500 LF and/or 0.50 acre of impact to jurisdictional waters as a project total, and travel through more than two county jurisdictions or more than one state jurisdiction shall be viewed as a whole project in the WQC process and require individual WQC of all crossings, except crossings utilizing directional boring.

As per Illinois Nationwide Permit Regional Conditions under Section 404 of the Clean Water Act:

- ▶ The Project does not propose Stormwater management facilities located within streams; and
- ▶ No newly constructed stream channels are proposed as part of the Project.
- ▶ Mitigation shall be constructed prior to or concurrent with the discharge of dredged or fill material.
- ▶ In-stream work will be limited to the shortest duration practicable and only within the immediate vicinity of the crossing as to limit disturbance.

As per Illinois Environmental Protection Agency Section 401 Water Quality Certification General and Regional Conditions:

- ▶ No Outstanding Resource Waters were identified within the Project area;
- ▶ No Project waterbody is listed as impaired by inorganic sediment, aquatic habitat alteration, or unknown impairment as listed on the most current Section 305(b) waterbody report (Available

- at: <http://www.epa.illinois.gov/topics/water-quality/watershed-management/tmdls/303d-list/index>);
- ▶ Consultation with the Illinois Department of Natural Resources has been initiated to address potential State threatened or endangered species;
 - ▶ Adequate planning and supervision will be provided during construction of the Project to ensure no violations occur under the Illinois Environmental Protection Act.
 - ▶ Excavated material shall not be sidecast into waters of the State for a period longer than 20 calendar days. Material shall not be placed in a manner that dispersion could occur.
 - ▶ Backfill material shall consist of clean course aggregate which will not cause siltation. Excavated material may be used only under dry conditions, and when particle size analysis demonstrates material to be 80% sand or larger using a #230 U.S. sieve.
 - ▶ Trenching activities within wetlands shall utilize excavated material to the extent practicable, with the upper six to twelve inches backfilled with the topsoil obtained during the excavation.
 - ▶ All excavated material not utilized as backfill shall be stored or disposed of with no discharge to waters of the State.
 - ▶ Oil and Gas construction projects are exempt from Illinois NPDES Stormwater permitting. Erosion control measures consistent with the Illinois Urban Manual shall be implemented.
 - ▶ All crossings utilizing a horizontal direction drill are certified provided that all pits and construction is located outside surface waters of the State, all drilling fluids are adequately contained from discharge to waters of the State, and erosion and sediment control is provided for the activity.
 - ▶ Temporary fills for work pads and access roads shall be constructed of clean course aggregate or non-erodible fill that will not cause siltation.
 - ▶ All temporary in-stream work must be designed to maintain normal flows.
 - ▶ Permanent access roads shall be constructed of clean course aggregate or non-erodible fill that will not cause siltation. These roads must maintain flow by utilizing culverts, bridges, or similar structures.

118 wetlands, 216 waterbodies, and 12 ponds were identified within the study area (Figure 2). Delineations were conducted during the growing season in order to effectively identify vegetation located within the study area.

Functions and values of existing wetlands within the Project study area may include food chain production, general habitat, nesting, spawning, rearing, and resting sites for aquatic and/or land species; maintaining natural drainage characteristics, sedimentation patterns, flushing characteristics, or natural water filtration processes, minimizing erosion or storm damage; serving as storage areas for storm or flood waters; providing groundwater discharge areas that maintain minimum baseflows; serving as natural recharge areas where surface water and groundwater directly interconnect; preventing pollution; and providing recreation.

In support of field findings, identified wetlands and waterbodies are summarized in Tables 1 and 2. Color photographs of additional features accompany these tables. Wetland and upland data forms corresponding with additional identified features are provided in Appendices A and B, respectively. Stream data forms are provided in Appendix C.

3.0 Conclusions

Wetland delineations and stream investigations within the Spire STL Pipeline Project study area were conducted from September 2016 through June 2017 within an approximately 300-foot wide corridor, generally centered on the proposed pipeline centerline. Field delineations were completed across parcels with landowner-granted access and desktop delineation methods were used where permission was not

granted at the time of survey. 118 wetlands, 216 waterbodies, and 12 ponds were identified within the study area. The results of the field study are provided in this report.

All statements in this document pertaining to the jurisdictional status of streams and wetlands with regard to USACE and state regulations represent the opinion of GAI and are based on current USACE guidance. The jurisdictional status of these features may be confirmed by a USACE Jurisdictional Determination.

Features denoted in ***bold italics*** contain new or revised data. Features denoted in **red text** have been removed from the current Project study area.

Notes:

¹ GAI map designation. Features designated with an asterisk (*) were located using desktop methods and have not been field verified due to property access constraints.

² Coordinates provided in NAD 83.

³ Palustrine system wetlands were classified as emergent (PEM), forested (PFO), scrub-shrub (PSS), or unconsolidated Bottom (PUB).

⁴ National Wetlands Inventory (NWI) wetland as mapped by the United States Fish and Wildlife Service.

⁵ Extent of wetland within study area. Wetland may extend beyond the limits of the delineation survey.

Features denoted in ***bold italics*** contain new or revised data. Features denoted in red text have been removed from the current Project study area.

Notes:

¹ GAI map designation. Features designated with an asterisk (*) were located using desktop methods and have not been field verified due to property access constraints.

² Coordinates provided in NAD 83.

³ Impairments as listed on the Illinois Integrated Water Quality Report and Section 303(d) List (2016) Available at: <http://www.epa.illinois.gov/Assets/iepa/water-quality/watershed-management/tmdls/2016/303-d-list/iwq-report-surface-water.pdf> or the Missouri Water Quality 305(b) Report (2014) and 303(d) list (2016). Available at: <http://dnr.mo.gov/env/wpp/waterquality/303d/303d.htm>.

⁴ As quantified in the field using Missouri Stream Mitigation Method assessment guidance (USACE, et al., 2013).

⁵ Extent of waterbody within study area. Waterbody may extend beyond the limits of the delineation survey.

UNT – Unnamed tributary; N/A – Not applicable.
